

ORGANIC ACID CONCRETE REMOVER

This product is a revolutionary concept in concrete removal! No longer must your team be exposed to toxic fumes and acids! This concrete remover is made from 100% biodegradable organic acids and surfactants. These technologically advanced acids are extracted from sugar canes and lemons. This enhances safety for users and the environment without compromising quality and effectiveness.

The acids penetrate deep into the concrete layer and hydrate it, loosening the bonds between the cement and the aggregates. This softened putty-like concrete can then be easily removed. The high foaming surfactants generate rich, stable foam that maximize coverage and contact time. The foam sticks to vertical surfaces unlike liquid sprays which run off too soon.

It does not release toxic gases and is not nearly as corrosive to skin or metals as mineral acid concrete removers.

DIRECTIONS

Dilute to strength required. Use at full strength for hard set concrete. For best results, foam the product onto the concrete and allow 10-30 minutes contact time.

The softened concrete can then be removed with a scraper, wire/nylon brush, or pressure washer.

For thicker layers of concrete, a second foam application may be required.
